

# How to Run Stepper Motor with Arduino using L298N Driver Module

Home / Arduino / How to Run Stepper Motor with Arduino using L298N Driver Module

admin, March 29, 2018, Arduino, 10 🞜

Hi Guys, In this post, I will demonstrate how you can run or control 6 wired unipolar stepper motor with Arduino using L298N driver module. The unipolar stepper motor has six wired but L298N driver module has two connectors either side to connect only four wire, I will show you how you can connect and run unipolar stepper motor with L298N driver.

## What is L298N driver module

Arduino is running on 5 volts and it's current output only 500mAmp, so run any dc motor direct with Arduino, not a good idea. Here is the motor driver comes, L298N driver module works on 6 volts to 35 volts and maximum current output is 2Amp. You can run either one stepper motor or two dc motors with this driver module. Learn How to run two DC motor with L298N driver module

# Step by step video guide for stepper motor, L298N driver and Arduino

# Arduino code for stepper motor and L298N driver module

```
#include
const int stepsPerRevolution = 200;
Stepper myStepper(stepsPerRevolution, 8, 9, 10, 11);
void setup() {
  myStepper.setSpeed(50);
  Serial.begin(9600);
void loop() {
  // step one for one direction:
  Serial.println("clockwise");
  myStepper.step(stepsPerRevolution);
  delay(400);
  // step one for other direction:
  Serial.println("counterclockwise");
  myStepper.step(-stepsPerRevolution);
  delay(400);
```

# Spread your Magic!

CircuitMagic is a platform where you can share your creations and DIY projects with the world. You can share the photo, video or step by step guide tutorial for the project.

#### Why publish here

Your ideas, your creativity... why only to yourself or to your friends. Share it with the whole world and spread your magic! Thousand's of users visit every day at CircuitMagic to post here their DIY projects. You can share with thousand's of people and make your follower.

Wow I had no idea I could use an L298N as a stepper driver. Just a few fixes to your code example and it ran great!

Perfectly working ok!

Thanks so much for sharing! I have tried with 12V 1A power supply. Also as a next step I gonna make a transistor array with 2SD1711 (which seems to be obsolete and very less expensive these days) So we can easily handle that power and heating problem.

Also see below the data sheets for the motor I have used 23KM-C057  $\,$ 

http://cnc25.free.fr/documentation/moteurs%20pap/pap\_nmb.pdf

All the best!

Anu

Very good example now your video motivate me to buy aurdino . Can you please tell me is it possible that if I want to rotate stepper motor to specific angle?

It is unfortunate that the L298n does not have any current control like the A4988 or other Pololu boards used in 3d printers. Some external circuitry is needed to limit the current. I will try the circuit I found here: bristolwatch.com/ele3/2a.htm
